remindify

The register for everything that *comes back.*

Obligations with an owner, a backup, a consequence — and proof that they were actually done.

Everyone is carrying a second job they never *applied for.*

Half of it is people.

THE PEOPLE SIDE

- A parent's medication and the refill that has to happen before Friday
- School forms, term fees, the trip consent nobody signed
- A friend's visa deadline you promised to track
- The family group chat that is the only system of record

Half of it is money.

THE MONEY SIDE

- Rent, payroll, the invoice that funds both
- Insurance renewal, tax filing, the licence that expires quietly
- Subscriptions, domains, the card that fails at 2am
- Deposits, refunds and the deadline to claim them

WHAT IT COSTS WHEN IT SLIPS

a lapsed policy | a fine | a payroll that bounces | a relationship that takes the hit

"Every one of them comes back. None of them has an owner."

The tools hold *fragments.* Nobody holds the obligation.

01

Calendars

Remember the date. Don’t know the consequence, the owner or the proof.

02

Task apps

List the work. No backup, no escalation, no record that it was done.

03

Accountants

Own one lane. The insurance renewal and the school form still live with you.

04

Marketplaces

Match a person to a job. Nothing carries over to next month.

Delegation has no receipt.

You cannot hand something over without evidence it came back done — so you keep it, and the list grows.

Agents have no accountability.

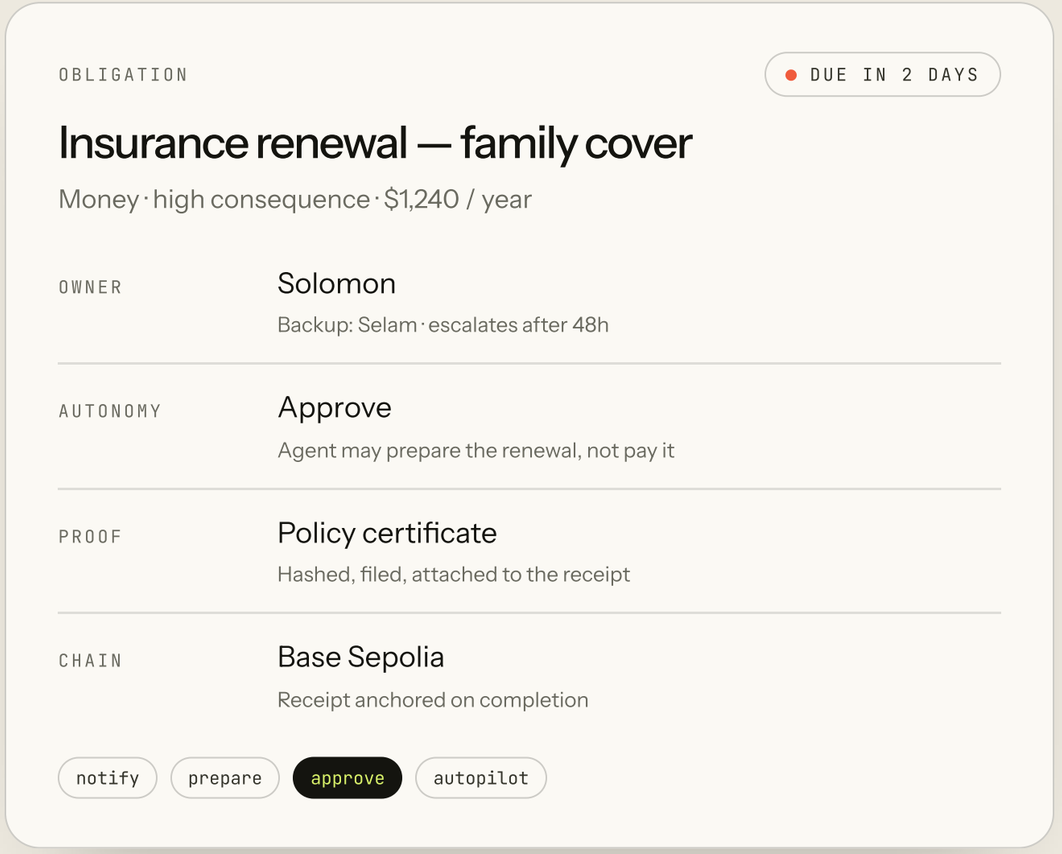

An agent can act, but a buyer cannot see its scope, its ceiling, or proof of what it actually did.

“It is invisible until it fails — and the failure costs more than the work ever did.”

One object, built to be *handed over.*

An obligation is not a reminder. It carries everything needed to survive being delegated: who owns it, who catches it, what happens if it slips, how far an agent may go, and what counts as done.

- **Risk** is severity × urgency × confidence × autonomy — with the money exposure and the plain-language consequence.
- **Autonomy** is a ceiling, not a switch. An agent earns each step.
- **Proof** is required by the item, not by the mood. No proof, no completion.
- **Everything** is attributed: reads, writes, approvals, runs, receipts, exports.

Two ledgers. One register. *One year mapped.*

THE PEOPLE SIDE	3
Dental check-up · Selam	2d overdue · appointment note
Mum's refill	Friday · pharmacy receipt
School trip consent	9d · signed form

THE MONEY SIDE	13
Rent — Kazanchis apartment	tomorrow · transfer ref
Family insurance renewal	12d · policy certificate
VAT filing · Q4	21d · filing receipt

"How much are you carrying?" The first screen counts both sides before it asks for an email.

COMMUNITY PACKS

A pack is a year someone already mapped. Import it, edit it, and it becomes yours — with the proof requirement attached.

Love & connection · The school year · Holidays · Tax filing · Home cover · Caregiving · Moving country · Subscriptions

Curated packs carry the curator, the country, the proof each item needs, and the number of times it has been forked.

PACK · TAX FILING · ETHIOPIA	9 ITEMS
VAT return · monthly	filing receipt
Withholding tax · monthly	filing receipt
Annual return · yearly	audited statement

Reminding is the commodity. *Completion* is the product.

PATH ONE

You do it

Open the item, see the consequence and the proof it needs, and close it with evidence. Thirty seconds, not thirty tabs.

e.g. sign the school form → proof: signed copy

PATH TWO

Your agent does it

Agents get passports: scopes, ceilings, credentials. They act inside the ceiling you set, then file proof — not a status update.

e.g. draft the renewal, stop for approval → proof: run log + receipt

PATH THREE

The bench does it

Hire a human or a community agent for one obligation. Fixed price, scoped access, USDC released when the proof is accepted.

e.g. file the return, fixed price → proof: accepted delivery, escrow releases

`notify` → `prepare` → `approve` → `autopilot` The ceiling is yours. The agent never sees more than the item.

OWNER + BACKUP
Who holds it, and who catches it if they go quiet.

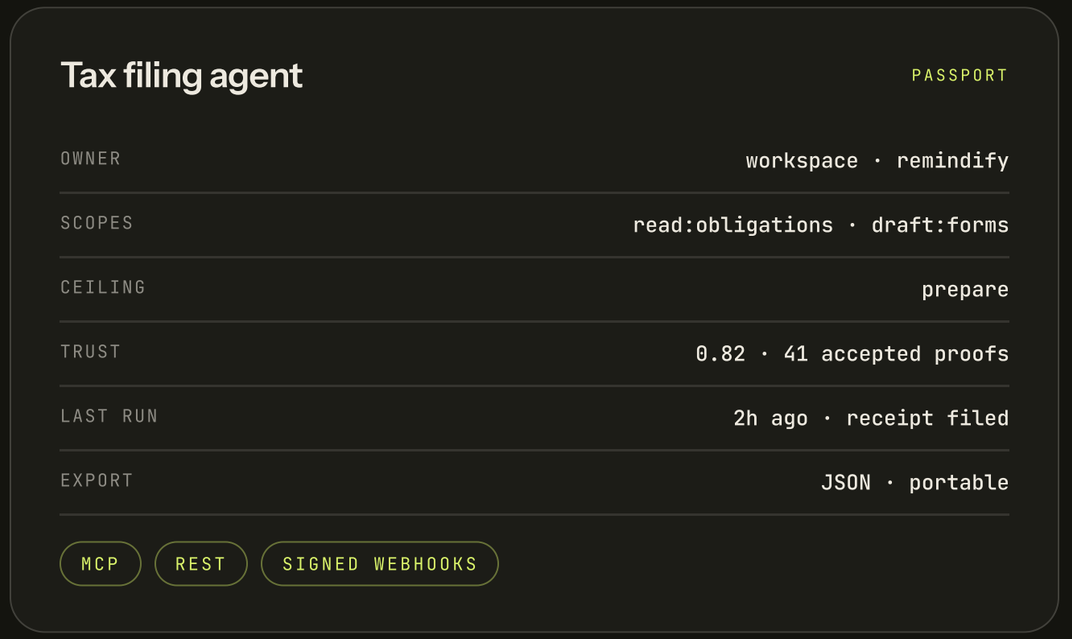

AUTONOMY CEILING
How far an agent may go before a human decides.

THE RECEIPT
What the register keeps when the work is done.

"A reminder tells you. Remindify finishes it — or proves why it didn't."

Agents are first-class *citizens*, not features.

- **Passports.** Scopes, trust score, success rate, autonomy ceiling, machine-readable export.
- **Earned autonomy.** An agent moves up by filing accepted proof — not by asking for permission.
- **Human/agent parity.** A chartered accountant and a tax-filing agent sit on the same bench, under the same proof standard.
- **Machine access.** REST and MCP, scoped keys, metering, idempotency, signed webhooks.
- **Containment.** No agent can act outside its ceiling, and every call is attributed in the audit trail.

"Autonomy is earned one accepted receipt at a time."

Proof, not promises. The chain checks the *work*.

01
Work happens
You, your agent or a provider completes the obligation and attaches the artifact.

02
Receipt is signed
Proof and evidence are hashed with keccak-256, then signed as EIP-712 typed data.

03
Anchor on Base
`anchored[receiptId] = true` — verifiable without trusting our database.

04
Payment releases
USDC escrow pays the provider only against that anchored receipt. No proof, no money.

NO TOKEN · NO CUSTODY · NO SERVER-HELD KEYS · NO DOCUMENTS ONCHAIN

anchor
0x8bc6…4288 · block 51,679,748

approve
0x5f17…f532 · block 51,679,761

fund
0xa935…cc66 · block 51,679,771

release
0x6ca7…70db · block 51,679,782

Recorded on Base Sepolia, 29 October 2026. anchored / funded / released read back from the contracts as true. Contracts are unaudited; mainnet follows a review.

For the buyer
Proof that the work happened, without having to trust our database or the provider's word.

For the provider
Payment on delivery, not on a promise. The same standard applies to a person and to an agent.

For platforms
Verifiable receipts over REST and MCP, so an insurer or bank can check work it did not run.

A working product, *honestly labelled.*

9	35	4	2	0
SURFACES SHIPPED	AUTOMATED TESTS	ONCHAIN TRANSACTIONS	CONTRACTS, VERIFIED	PAYING USERS

WHAT IS LIVE

- Public demo with per-account workspaces, email/password, Google and wallet sign-in
- Today, Obligations, Capture, Agents, Marketplace, Seller desk, Activity, Trust, Agent Access
- 16 seeded obligations, 7 agents, 8 providers, community packs, People/Money lenses
- REST and MCP access with scoped, metered, idempotent keys
- Postgres in production, SQLite locally; auth, digests, retention, region gating

WHAT IS NOT

- No paying users yet — pre-revenue, deliberately
- Contracts are on Base **Sepolia**, not mainnet
- The contracts are **unaudited**
- No Celo integration, ERC-8004 or Self Agent ID yet
- Repo stays private until a program requires open source

Next milestone: ten design partners on Base, then the first paid workspace.

OPEN THE PRODUCT	ATTESTATIONS CONTRACT	RECORDED RELEASE

Start where the *obligation density* is highest.

Founders, freelancers and small studios in Addis Ababa and the diaspora. Global obligations, no back office, mobile-first, and money that already moves in dollars.

- They already pay for fragments — an accountant, a broker, a virtual assistant — and still miss things.
- Their counterparties are abroad, so “the proof is in my email” is not good enough.
- One overdue renewal costs more than a year of the product.

THE LADDER

Now

Addis + diaspora founders, freelancers and studios. Direct sales, community packs, one design partner at a time.

Next

English-speaking solo operators globally: consultants, landlords, small agencies with recurring filings.

Then

Teams and platforms. Insurers, banks and telcos embed the renewal layer instead of building a task system.

“Remindify inside” — the obligation and proof layer licensed to institutions that already own the customer relationship.

A four-person studio
Client invoices, VAT filings, three contractors — and no operations hire.

A diaspora landlord
Property in Addis, tenants paying from abroad, insurance renewing in dollars.

A consultant with US clients
Contracts, W-8, quarterly estimates, and a visa that expires quietly.

Priced against the *penalty*, not against a to-do list.

STREAM	PRICE	WHAT IT IS
Personal	$0	25 live obligations, both ledgers, packs, proof vault. The preview that creates the habit.
Studio	$18/mo	Unlimited obligations, agent passports and ceilings, marketplace hiring, shared workspace and backups.
Operator	$48/mo	Unlimited seats and agent keys, scoped API + MCP, custom proof rules, Base anchoring controls, migration help.
Marketplace	15%	Take on completed human and agent work. The provider is paid only when proof is accepted.
Agent platform	Usage	Metered REST/MCP access, webhook events and verified receipts for agents built by others.

Why people pay: a lapsed policy, a missed filing or a failed payroll costs far more than a monthly seat. The product is priced against the consequence.

$1,240

One lapsed family policy — the number on the obligation card.

$18/mo

The Studio seat that keeps it from lapsing. Priced against the penalty.

Cheap proof. Real dollars. An *agent economy.*

Anchor economics

Receipts are small and frequent. Base is the only place where anchoring one costs less than the risk it removes.

USDC is the rail

Our first users already hold and move dollars across borders without a local card rail. Settlement should match the asset they use.

Agents are the thesis

Base funds agent infrastructure explicitly. Our agents act under scoped passports and file proof — not chat transcripts.

ALREADY ON BASE

Attestations and escrow contracts deployed to Base Sepolia, source-verified on Basescan, full anchor → approve → fund → release lifecycle rehearsed with recorded transactions.

`0x22C9…F7f9` attestations `0x647F…72db` escrow `4` verified txns

DELIBERATELY NEXT

Mainnet after a contract review. Celo reuses the same EVM module for a pilot. Ethiopia stays offchain until the NBE authorises virtual-asset activity — no wallets, no USDC, no exceptions.

AGENTS ARE BECOMING COMMERCE

Agents are starting to transact, not just answer. The accountability layer for delegated work does not exist yet.

DOLLARS ALREADY MOVE

Stablecoin settlement is normal for the freelancers and diaspora families we start with — the rail is no longer the barrier.

ADMIN LOAD IS RISING

More tools, more jurisdictions, more renewals per person. The second job is getting bigger, not smaller.

What the next *eighteen months* buy.

NOW

- Register, risk engine, autonomy, proof, audit
- Nine surfaces, REST + MCP, seller desk
- Base Sepolia contracts + rehearsal
- Per-account Postgres workspaces

90 DAYS

- Base mainnet + contract review
- Ten design partners onboarded
- Mobile capture and calendar sync
- First paid Studio workspaces

12 MONTHS

- Inbox and document ingestion
- Provider onboarding, ratings, disputes
- Agent SDK and verified badges
- Celo pilot with the same module

18 MONTHS

- 1,000 marketplace jobs at 95% proof acceptance
- Three platforms embedding the API
- Team approvals, SSO, retention
- 10,000 activated users

The bet: proof-of-done becomes the default way small teams delegate.

10,000
ACTIVATED USERS

1,000
JOBS AT 95% PROOF ACCEPTANCE

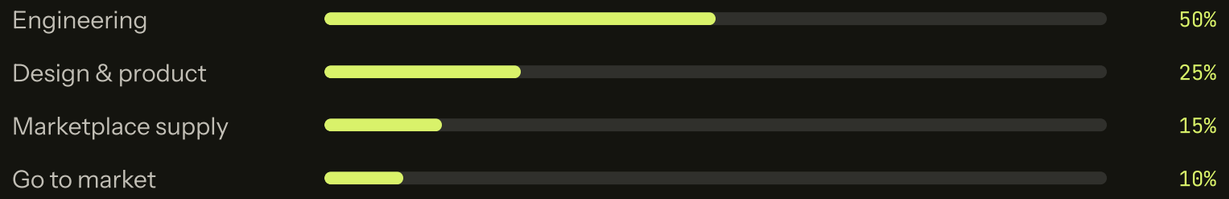

3
PLATFORM DESIGN PARTNERS

$400k

for 10% · 18-month runway

Enough to get the trust layer to mainnet, ten design partners live, and the first thousand marketplace jobs proven.

PRE-SEED · BASE-FIRST · NO TOKEN

MILESTONES

- 10,000 activated users
- 1,000 marketplace jobs at 95% proof acceptance
- Three design partners embedding the API
- Base mainnet trust layer after a contract review

DILIGENCE
Everything in this deck is checkable.

CONTRACTS
sepolia.basescan.org · 0x22C9…F7f9

REHEARSAL
anchor → fund → release, 4 txns

The register is the asset. The receipts are the moat.

remindify-xi.vercel.app

One founder who has shipped for the *first users.*

Solomon Tigabu

FOUNDER / CEO · ADDIS ABABA

Software engineer, designer and operator. CTO and Master Trainer at Exopya Incubation Center, working hands-on with early-stage teams; 600+ designs and 8 brand builds.

Built the product end to end — interface, API, agents, contracts and deployment — for the same kind of teams Remindify starts with: global obligations, no back office, everything held in one person's head.

WHY THIS IS CREDIBLE

- The pain is lived, not researched: this is the register I needed for my own life.
- Shipped, tested and deployed — not a concept deck.
- The trust layer is real on Base Sepolia, with hashes a reviewer can check.
- Solo today, hiring engineering first with this round.
