remindify

The register for everything that *comes back.*

Obligations with an owner, a backup, a consequence — and proof that they were actually done.

Every business is carrying a back office nobody *put on the org chart.*

Half of it is duty.

VENDORS & REGULATORS

- A contractor's W-9 that has to be refreshed before the next invoice clears
- A compliance filing due on a date the founder keeps discovering late
- A work permit or licence that expires quietly while the quarter moves
- The vendor email thread that is the only system of record

Half of it is money.

MONEY & OPS

- Payroll, the studio lease, and the invoice that funds both
- Equipment loans, tax instalments, the licence that expires quietly
- SaaS renewals, domains, the card that fails at 2am
- Deposits, refunds and the deadline to claim them

WHAT IT COSTS WHEN IT SLIPS

a lapsed policy | a fine | a payroll that bounces | a client relationship that takes the hit

"Every one of them comes back. None of them has an owner."

The tools hold *fragments.* Nobody holds the obligation.

01

Calendars

Remember the date. Don’t know the consequence, the owner or the proof.

02

Task apps

List the work. No backup, no escalation, no record that it was done.

03

Accountants

Own one lane. The insurance renewal and the contractor’s W-9 still live with you.

04

Marketplaces

Match a person to a job. Nothing carries over to next month.

Delegation has no receipt.
You cannot hand something over without evidence it came back done — so you keep it, and the list grows.

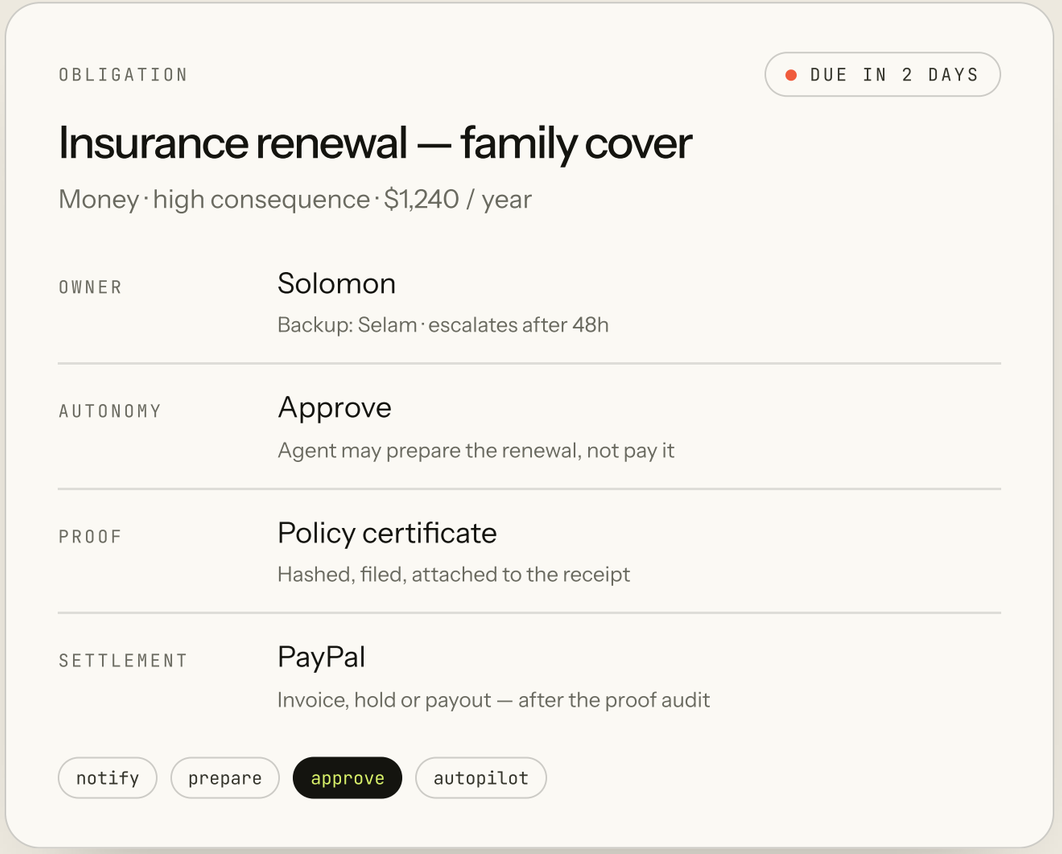

Agents have no accountability.
An agent can act, but a buyer cannot see its scope, its ceiling, or proof of what it actually did.

“It is invisible until it fails — and the failure costs more than the work ever did.”

One object, built to be *handed over.*

An obligation is not a reminder. It carries everything needed to survive being delegated: who owns it, who catches it, what happens if it slips, how far an agent may go, and what counts as done.

- **Risk** is severity × urgency × confidence × autonomy — with the money exposure and the plain-language consequence.
- **Autonomy** is a ceiling, not a switch. An agent earns each step.
- **Proof** is required by the item, not by the mood. No proof, no completion.
- **Everything** is attributed: reads, writes, approvals, runs, receipts, exports.

Two ledgers. One register. *One year mapped.*

DUTY & FILINGS	3
Contractor NDA · Kestrel	2d overdue · signed NDA
W-9 refresh · Kestrel	5d · signed W-9
Work permit renewal	9d · stamped permit

MONEY & OPS	13
Studio lease — Kazanchis	tomorrow · transfer ref
Professional indemnity · Awash	12d · policy certificate
VAT filing · Q4	21d · filing receipt

“What is the back office carrying?” The first screen counts both sides before it asks for an email.

COMMUNITY PACKS

A pack is a year someone already mapped. Import it, edit it, and it becomes yours — with the proof requirement attached.

Vendor lifecycle · Contractor deliverables · Vendor onboarding · Tax & filings · Premises & cover · Workplace safety · Entity expansion · Subscription audit

Curated packs carry the curator, the country, the proof each item needs, and the number of times it has been forked.

PACK · TAX FILING · ETHIOPIA	9 ITEMS
VAT return · monthly	filing receipt
Withholding tax · monthly	filing receipt
Annual return · yearly	audited statement

Reminding is the commodity. *Completion* is the product.

PATH ONE

You do it

Open the item, see the consequence and the proof it needs, and close it with evidence. Thirty seconds, not thirty tabs.

e.g. sign the contractor's NDA → proof: signed copy

PATH TWO

Your agent does it

Agents get passports: scopes, ceilings, credentials. They act inside the ceiling you set, then file proof — not a status update.

e.g. draft the renewal, stop for approval → proof: run log + receipt

PATH THREE

The bench does it

Hire a human or a community agent for one obligation. Fixed price, scoped access, PayPal escrow released when the proof is accepted.

e.g. file the return, fixed price → proof: accepted delivery, escrow releases

`notify` → `prepare` → `approve` → `autopilot` The ceiling is yours. The agent never sees more than the item.

OWNER + BACKUP
Who holds it, and who catches it if they go quiet.

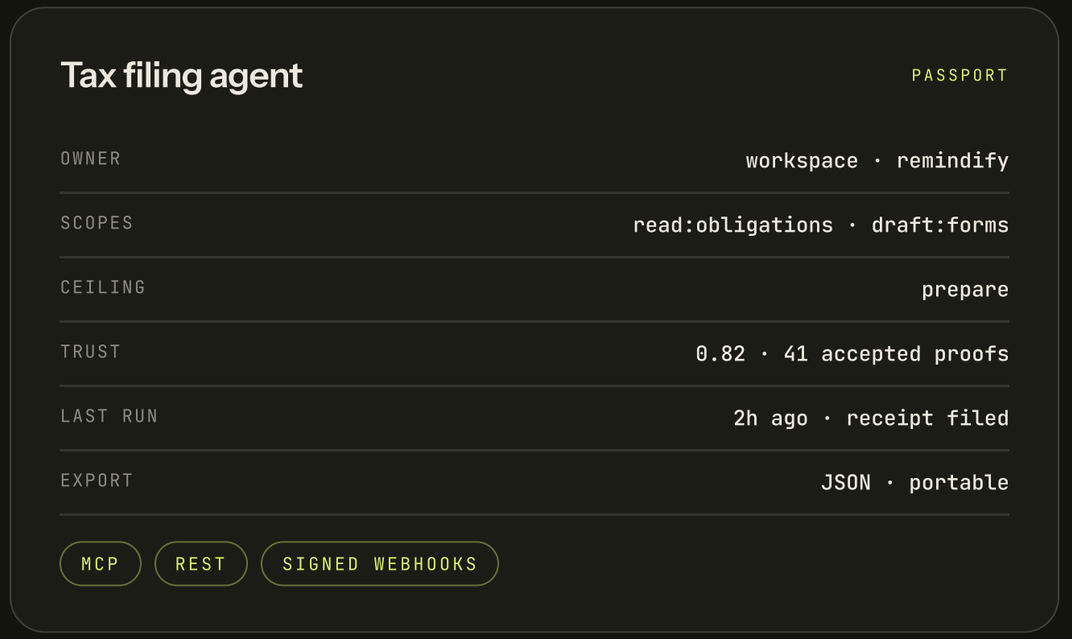

AUTONOMY CEILING
How far an agent may go before a human decides.

THE RECEIPT
What the register keeps when the work is done.

"A reminder tells you. Remindify finishes it — or proves why it didn't."

Agents are first-class *citizens*, not features.

- **Passports.** Scopes, trust score, success rate, autonomy ceiling, machine-readable export.
- **Earned autonomy.** An agent moves up by filing accepted proof — not by asking for permission.
- **Human/agent parity.** A chartered accountant and a tax-filing agent sit on the same bench, under the same proof standard.
- **Machine access.** REST and MCP, scoped keys, metering, idempotency, signed webhooks.
- **Containment.** No agent can act outside its ceiling, and every call is attributed in the audit trail.

"Autonomy is earned one accepted receipt at a time."

Proof, not promises. PayPal moves money *after the audit.*

01
Work happens
You, your agent or a provider completes the obligation and attaches the artifact.

02
Receipt is signed
Proof and evidence are hashed and signed with HMAC-SHA256, then stored on the register.

03
The auditor checks
Gemini 2.5 Flash reads the artifact against the proof required. Below the confidence floor, nothing releases.

04
PayPal settles
Capture the authorization hold and pay the provider with PayPal Payouts. No proof, no money.

NO TOKEN · NO CUSTODY · NO BALANCE HELD · NO DOCUMENTS UPLOADED

invoice
INV2-DEMO-2401 · $2,400 · sent

hold
authorization · $450 · 29-day window

audit
verified · confidence 0.94

payout
$405 net · PayPal Payouts

Rehearsed on the PayPal sandbox: invoicing, authorization holds and payouts, with the 10% application fee deducted from the captured amount. Live money needs a PayPal business account.

For the buyer
Proof that the work happened, without having to trust our database or the provider's word.

For the provider
Payment on delivery, not on a promise. The same standard applies to a person and to an agent.

For platforms
Verifiable receipts over REST and MCP, so an insurer or bank can check work it did not run.

A working product, *honestly labelled.*

9	52	3	10%	0
SURFACES SHIPPED	AUTOMATED TESTS	PAYPAL FLOWS WIRED	APPLICATION FEE	PAYING USERS

WHAT IS LIVE

- Public demo with per-account workspaces, email/password and Google sign-in
- Today, Obligations, Capture, Agents, Marketplace, Seller desk, Activity, Trust, Agent Access
- 19 seeded obligations, 10 agents, 11 providers, community packs, duty/money lenses
- REST and MCP access with scoped, metered, idempotent keys
- Postgres in production, SQLite locally; auth, digests, retention, region gating

WHAT IS NOT

- No paying users yet — pre-revenue, deliberately
- PayPal runs in the **sandbox** — no live merchant account yet
- Invoices and holds are single-currency today
- Partial captures for milestone work are still ahead
- Repo is public with an MIT licence; this deck is a pre-seed story, not a traction claim

Next milestone: ten design partners on the PayPal sandbox, then the first paid workspace.

OPEN THE PRODUCT	DEVELOPER DOCS	TRUST LAYER
`remindify-paypal.vercel.app`	`docs · REST + MCP`	`receipts · escrows`

Start where the *obligation density* is highest.

Founder-led businesses and small studios in Addis Ababa and the diaspora: contractors, filings and invoices in dollars, with no back office to keep them straight.

- They already pay for fragments — an accountant, a broker, a virtual assistant — and still miss things.
- Their counterparties are abroad, so “the proof is in my email” is not good enough.
- One overdue renewal costs more than a year of the product.

THE LADDER

Now

Addis + diaspora founder-led businesses and studios. Direct sales, community packs, one design partner at a time.

Next

English-speaking small businesses globally: consultancies, agencies and studios with recurring vendor and filing work.

Then

Teams and platforms. Insurers, banks and telcos embed the renewal layer instead of building a task system.

“Remindify inside” — the obligation and proof layer licensed to institutions that already own the customer relationship.

A four-person studio
Client invoices, VAT filings, three contractors — and no operations hire.

A diaspora services firm
US and EU clients, a contractor bench, W-9s and monthly invoices — no operations hire.

A founder with US clients
Contracts, W-9, quarterly estimates, and a work permit that expires quietly.

Priced against the *penalty*, not against a to-do list.

STREAM	PRICE	WHAT IT IS
Solo	$0	25 live obligations, both sides of the operation, packs, proof vault. For the founder who is the whole back office.
Studio	$18/mo	Unlimited obligations, agent passports and ceilings, marketplace hiring, shared workspace and backups.
Operator	$48/mo	Unlimited seats and agent keys, scoped API + MCP, custom proof rules, PayPal settlement controls, migration help.
Marketplace	10%	Application fee on captured escrow. The provider is paid only when proof is accepted.
Agent platform	Usage	Metered REST/MCP access, webhook events and verified receipts for agents built by others.

Why people pay: a lapsed policy, a missed filing or a failed payroll costs far more than a monthly seat. The product is priced against the consequence.

$1,240

One lapsed policy or missed filing — the number on the obligation card.

$18/mo

The Studio seat that keeps it from lapsing. Priced against the penalty.

Money already moves. The proof layer *does not*.

Trust is the rail

Buyers and providers already hold PayPal balances. We do not ask them to open a wallet or learn a new payment rail.

Invoice, hold, payout

Invoicing collects receivables, authorization holds protect a purchase for up to 29 days, and Payouts pays the provider by email.

Agents are the thesis

Agents are becoming commerce. PayPal is building for agentic payments; Remindify supplies the accountability layer on top.

ALREADY WIRED

Orders v2 authorization and capture, Payouts v1, Invoicing v2, webhooks and idempotency keys. The sandbox flow runs from invoice to proof to payout.

Orders v2 holds **Payouts v1** settlement **Invoicing v2** receivables

DELIBERATELY NEXT

Live merchant onboarding, multi-currency invoices and partial captures for milestone work. Every release stays gated by a verified proof receipt.

AGENTS ARE BECOMING COMMERCE

Agents are starting to transact, not just answer. The accountability layer for delegated work does not exist yet.

PAYPAL IS THE TRUST RAIL

Buyers already trust the brand, the dispute process and the payout. We do not have to teach a new payment primitive.

ADMIN LOAD IS RISING

More tools, more jurisdictions, more renewals per person. The second job is getting bigger, not smaller.

What the next *eighteen months* buy.

NOW

- Register, risk engine, autonomy, proof, audit
- Nine surfaces, REST + MCP, seller desk
- PayPal sandbox: invoices, holds, payouts
- Per-account Postgres workspaces

90 DAYS

- Live PayPal merchant access
- Ten design partners onboarded
- Mobile capture and calendar sync
- First paid Studio workspaces

12 MONTHS

- Inbox and document ingestion
- Provider onboarding, ratings, disputes
- Agent SDK and verified badges
- Multi-currency invoices and partial captures

18 MONTHS

- 1,000 marketplace jobs at 95% proof acceptance
- Three platforms embedding the API
- Team approvals, SSO, retention
- 10,000 activated users

The bet: proof-of-done becomes the default way small teams delegate.

10,000
ACTIVATED USERS

1,000
JOBS AT 95% PROOF ACCEPTANCE

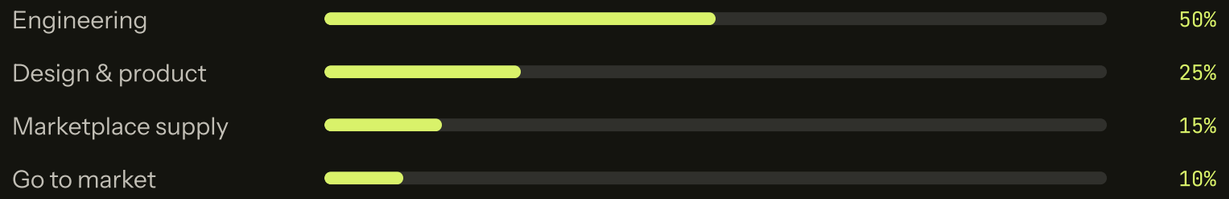

3
PLATFORM DESIGN PARTNERS

$400k

for 10% · 18-month runway

Enough to take the trust layer live on PayPal, get ten design partners running, and prove the first thousand marketplace jobs.

PRE-SEED · PAYPAL-FIRST · NO TOKEN

MILESTONES

- 10,000 activated users
- 1,000 marketplace jobs at 95% proof acceptance
- Three design partners embedding the API
- Live PayPal settlement after merchant review

DILIGENCE
Everything in this deck is checkable.

RAILS
PayPal Orders v2 · Payouts v1

REHEARSAL
invoice → hold → audit → payout

The register is the asset. The receipts are the moat.

remindify-paypal.vercel.app

One founder who has shipped for the *first users.*

Solomon Tigabu

FOUNDER / CEO · ADDIS ABABA

Software engineer, designer and operator. CTO and Master Trainer at Exopya Incubation Center, working hands-on with early-stage teams; 600+ designs and 8 brand builds.

Built the product end to end — interface, API, agents, payments and deployment — for the same kind of teams Remindify starts with: global obligations, no back office, everything held in one person's head.

WHY THIS IS CREDIBLE

- The pain is lived, not researched: this is the register I needed for my own life.
- Shipped, tested and deployed — not a concept deck.
- The trust layer is real on the PayPal sandbox, with receipts a reviewer can check.
- Solo today, hiring engineering first with this round.
